

PRODUCT MANAGER / PRODUCT OWNER

Yebeen (Bea) Kang

Five years as a PM across a 7M MAU commerce platform, a new platform launch in France, and a B2B2C SaaS product. Lately I've been using AI to actively push out the boundary of what a single PM can cover. I want to work on products that stay connected to reality, and to widen the range of problems I can solve.

garding3@gmail.com [LinkedIn ↗](#)

Based in Seoul, South Korea · Open to relocation

I UNDERSTAND THE PRODUCT, THE USER, AND THE BUSINESS

A platform creates business opportunity by defining and solving users' problems. When that understanding is thin, it adds product complexity and operational load. I go to users directly, close the gaps in understanding, and define the problem precisely. From there I set the product's direction, fast.

I LOOK FOR MY OWN LESSONS LEARNED

A PM has to raise the quality of both the product and the collaboration around it, which means retrospecting on experience and keeping the improvements coming. I wrote up what I learned and what fell short after every project, and built a team habit of retrospecting together.

EXPERIENCE

kakaostyle · Commerce Platform Planning / Global TF
Jul 2022–Mar 2026

EDUCATION

Seoul Women's University · B.A. Business Administration
2016–2021

methinks · Product Manager

Jan 2021–Jan 2022

methinks · UX Research Intern

Oct 2020–Jan 2021

Tsinghua University · Exchange program

Aug 2019–Feb 2020

PROJECTS

KAKAOSTYLE · GLOBAL BEAUTY TF

Piyonna

Product Manager · Dec 2025–Mar 2026

Led the launch of a K-beauty platform in France, applying AI throughout: local research, competitor data scraping, building the ops site, and policy design.

KAKAOSTYLE

Zigzag

Commerce Platform Planning / PO · 2022–2026

Led projects across seeding, reviews, coupons, and promotions on a commerce app with 7M MAU.

METHINKS

B2B2C Research Platform

Product Manager · 2021–2022

Feature design and business-client communication for a research SaaS web and app platform.

METHINKS

UX Research

Research Intern · 2020–2021

Ran enterprise UX research projects, owning product usability tests, interview moderation, and reporting.

Zigzag: Commerce Platform

Commerce Platform Planning / Product Owner · Jul 2022–Mar 2026

Zigzag is kakaostyle's fashion commerce platform, serving 7M MAU in Korea. I ran user research continuously, defined product and KPI roadmaps, and owned iteration, the backlog, and project management.

Seller Seeding Promotion

BACKGROUND

Cutting review-point payouts to save cost dropped review-submission rates by 40%. Reviews drive both purchase intent and seller sales, so we needed another way to generate them. Business teams were already running seeding manually every week, spreadsheet by spreadsheet (selecting products, recruiting users, booking placements, issuing coupons), which capped how far it could scale.

Hypothesis: turning seeding into a real product, productizing the operating cost sellers were already paying for informally, would recover review volume by leveraging what sellers wanted anyway.

ACTION

Defined and led the full seeding product cycle end to end (seller application → selection → product exposure → user application → winner selection → purchase → review) and iterated on it using metrics and seller interviews:

Seeding order-success rate fell from 95% to 75%: added a penalty mechanism that issues points when a seller fails to ship without notice, plus pre-order creation, recovering the success rate to 99%.

Also owned policy: winner criteria, per-cycle scheduling, listed-product conditions (quantity, shipping, attributes), order/settlement policy, and seller/customer penalties, coordinated with legal and CS.

5+ / team → 0

COVERAGE

Dailian [Zigzag pilots a seeding corner to grow authentic reviews \(Korean\)](#) ↗

kakaostyle Partner Lounge [How the seeding promotion performed for real stores \(Korean\)](#) ↗

LESSON LEARNED

Product quality comes from iterating against users and metrics, not from a single launch. Shipping fast and fixing repeatedly, rather than shipping perfect, is what let the program expand into influencer seeding and an internal-employee segment.

Coupon Upsell A/B Test

BACKGROUND

Outside promotion periods, average order value was trending down. An earlier cart-level coupon UI had raised coupon costs enough that it couldn't be rolled out platform-wide, so the goal became growing the AOV lift enough to offset the added coupon cost.

Hypothesis: a UI that lets users feel the benefit before checkout would nudge them into buying more.

ACTION

Designed the experiment: defined the recommended-coupon logic and what to surface (savings amount, extra discount, recommended products) and the funnel. Ran it by varying recommendation pattern (single vs. unlimited), timing (campaign vs. regular), and product logic (personalized vs. ranked) to find a winner, tracking average order value, item count, and cart additions with the data team.

RESULTS

Banner CTR	Add-to-cart after entry	AOV lift vs. added coupon cost
3.8%	70%	net positive

CTR came in low, read as weak initial framing and incentive, but the lift in payment per order (about ~~¥~~\$2,000) outweighed the rise in coupon cost per order (about ~~¥~~\$1,000) in the test group.

LESSON LEARNED

Maker buy-in decides how fast and how far an experiment goes. Winning over an owner worried about checkout usability took time, so the final UX shipped more conservative than intended, and coupon budget, a variable outside the product's control, kept the test extending instead of scaling. Now I settle the guardrails on what I cannot control and win the room before build starts.

Five years of an admin tool built up through legacy patches had made issuing a coupon error-prone: 20+ misissued coupons a month, each one costing compensation, CS time, and product-team cleanup.

Interviewed and shadowed the business team's actual coupon workflow to define the problem, then rebuilt the tool: review and approval steps scoped to what's being applied, faster approval paths, and terminology and hierarchy that matched how the business side actually talks about it. Led the cross-functional build end to end (backend, frontend, design, schedule, QA, release) and ran a company-wide session walking every business team through the new process, legacy data, and rollout timeline.

After: creation, lookup, and approval in one flow

LESSON LEARNED

Knowing the seller and AMD workflow before, during, and after coupon creation is what let the process come together quickly. An admin built from watching the actual work, not from assumptions, is what saves users time. I still go find the user myself.

Stacked Coupon Structure

BACKGROUND

At a 40% fee disadvantage to competitors, coupon cost was already being passed to sellers, capping how aggressive a single discount could get, right as a competitor's DAU was trending up and the need for a visible value signal was growing.

Hypothesis: letting a second coupon stack on top of the first would sharpen price competitiveness and lift order value.

ACTION

Designed the stacked-coupon funnel (issuance, display, application, settlement) and built it with the admin team. Beyond the MVP, added price and badge treatment at every coupon-download point (PLP, PDP) and an estimated-lowest-price module, plus a gauge-bar UI (home → campaign → PDP → cart) showing progress toward the stacked discount, built as a reusable admin feature for future promotions.

RESULTS

Order value, YoY

+20%

Items per order

2.3 → 3.2

LESSON LEARNED

The follow-up usability work never shipped: the A/B test showed it cost more than it returned. The structural fix landed but its reach stayed capped, because company-wide cost targets and the product's own usage target pointed in opposite directions. Now I check that alignment with the team and leadership throughout a project, not once at kickoff.

First-Purchase Deal

BACKGROUND

New-user acquisition was down about 20% (60K in Q1 '23), and coupons alone couldn't move fast enough (fixed expiry, no easy way to shift eligibility as sell-through changed), so the platform needed something more agile to hook a first purchase.

Hypothesis: a dedicated first-purchase price, shown conditionally with the operating tools to run it, would lift first-purchase conversion.

ACTION

Defined the core funnel and policy (display → checkout → order → claims) and modeled the settlement and refund impact: sellers absorbing promo pricing was affecting which products they'd list, and under-counted fee rates risked understating revenue, so the pricing type and settlement structure were built to let the platform absorb the discount instead. Sampled logs by user segment to prioritize the home → event page → PDP → cart → checkout funnel, cut low-engagement screens from MVP in favor of an in-app push, and led the project across five product teams (placement, order, claims, settlement, and business/CS policy).

RESULTS

Monthly new buyers, YoY

+40%

Revisit rate (deal vs. coupon first-purchase)

40% vs. 33%

Repeat-purchase rate

2.8% → 5.8%

LESSON LEARNED

Collaboration starts by aligning on the product's purpose, background, and impact. With display and backend split across teams, priorities differ, and that gap shows up directly in quality and timeline. I use a weekly sync to share target metrics and rollout plans, and to stay in sync with makers on how much the product matters.

Discounted-Price Structure by Option

BACKGROUND

Zigzag's catalog grew out of syncing sellers' own storefronts, and about half of listed products still work that way, creating two problems: a flat discount entered by a seller could double-stack with price changes on their own storefront, sometimes selling well under intended price; and discounts applied at the product level meant every option under it needed its base price adjusted by hand. The goal was a pricing structure flexible enough to run in-app discounts, decoupled from the seller's own storefront.

ACTION

Led the rollout schedule and internal communication, and planned the seller and internal admin end to end, including a backlog of edge cases: hidden or sold-out options were still surfacing at sale price and being exploited by some sellers, so the new logic shipped with an exception path for those states. In the seller admin, defined how a discount is deducted, calculated, paused, edited, deleted, and displayed. Because 90%+ of sellers used the existing discount data and the change touched settlement-linked screens, ran onboarding sessions for MD, PM, and operations teams across every business category and documented the change with FAQs and setup examples.

RESULTS

Discount-rate gap vs.
competitors

closed

↳ 옵션 c		10,000 (옵션 데이터 등록)	10,000	X

LESSON LEARNED

A pricing feature that ships with a config error turns into cancelled orders, settlement correction, and compensation, fast. For two weeks post-launch, I tracked company-wide support keywords daily and reviewed them each morning with the team to catch issues early.

A database migration required a 1–2 hour write freeze, communicated in advance, but a missed cache/traffic test meant a same-day rollback of every affected feature and a three-week delay renegotiating the window. Even a "purely technical" risk is worth one more check with engineering before it ships.

First-Come Order Coupon

BACKGROUND

Standard first-come coupons cap out at issuance: once the quota is gone, a high-intent user about to order gets nothing, and a user who already claimed one has no reason left to convert. Usage sat under 30%.

Hypothesis: a coupon type that decrements on order instead of on issuance would roughly double redemption by staying live for buyers all the way to checkout.

ACTION

Led the product definition for an order-quota coupon and the CMS and cart surfaces showing it: requested a new "orderable quantity" field alongside issued quantity in the coupon service and coordinated the admin build, designed a remaining-quantity indicator shown at cart and redemption, and worked with the content team to add a live quantity counter to the first-come content module. Watched VOC in real time after release and responded same-day.

RESULTS

Redemption rate vs. standard first-come issuance

~80% of orders **+50pp**

Caught buyers using deferred payment methods to lock in quantity ahead of checkout and shipped a fix the same day the campaign went live; surfaced issuance history and policy in the coupon wallet after a spike in "this is just for traffic" complaints as the coupon ran low.

LESSON LEARNED

During the two-week Black Friday run, 100+ VOC threads on day one dropped to zero. Every morning I read the unfiltered VOC sheet myself, sorted each case by root cause — product policy, missing on-screen information, stability — and pushed same-day fixes with the team. Checking every day instead of putting it off is its own skill.

Launching a K-beauty platform in France

Product Manager · Dec 2025–Mar 2026

A new business buying from beauty brands listed on Zigzag and reselling to French customers. I defined the market, the target customer, and the product structure from zero, and launched within three months. I actively stretched the PM role along the way: AI-assisted research, building an internal ops site, and data scraping.

BACKGROUND

K-beauty's popularity in Europe was rising, and with it beauty brands' appetite for selling abroad, so the company planned a new business line.

The plan was to buy inventory from beauty brands listed on Zigzag and resell it to French customers. I joined on the condition of finishing the launch within three months of the date I gave notice.

ACTION 1: SCOPE THE RESEARCH TO THE LAUNCH DECISION

- Ran interviews with five French shoppers to derive the site's selling points and must-haves.
 - How K-beauty and overseas products are perceived locally, and the purchase journey
 - What drives purchase decisions locally, and where it differs

TWO SELLING POINTS

- **Prove that real Koreans use these products.**
 - French shoppers wanted to confirm whether a product was genuinely popular with locals. We decided to process and surface the user reviews accumulated on Zigzag.

- **Hold a price advantage over competitors.**

- For the initial entry we bought inventory, so margin was ours to set. The strategy was to price below competitors, even by a dollar.

ACTION 2: PM WORK TO MAKE THE SELLING POINTS REAL

Beyond core product specs, I took on the following to speed up the launch and shrink grey zones inside the TF.

- **Competitor price and category scraping and reporting**

- An automated daily pull of competitor products and prices, handed to the merchandising team so they could set pricing against live market data rather than assumption.

- **Review data localization pipeline**

- Built a page to run review-data extraction, prompting, and display QA against Zigzag's review data, and shared it with the team.

Live creative from piyonna.com, the storefront after launch.

[Visit piyonna.com](https://piyonna.com) ↗

OUTCOME

The product designer, engineer, localization specialist, and merchandisers all worked off these two systems.

The platform launched inside the three-month target and is live.

LESSON LEARNED

A PM's job no longer stops at writing specs and running the project. The path to launch is full of gray zones nobody owns, and spotting them and acting on them is what matters now. As AI tools improve, the range one person can actually execute has widened with them. On this project, the work that fell outside anyone's role is work I found and handled myself.

B2B2C Research Platform

Product Manager · Jan 2021–Jan 2022

Owned feature design and business-client communication for a research SaaS web and app platform.

WHAT I OWNED

- Defined respondent-quality criteria and the filtering logic: designed a dashboard that measures interviewee reliability by combining a user's own data.
- Ran QA, and organized use cases and reviewed them with the team whenever a new feature shipped (U.S./KR).
- Collected requirements from internal and external clients and balanced priorities to raise productivity.

Recruitment / fraud-detection admin, and English spec documentation

LESSON LEARNED

On-time delivery is the top priority

As a B2B2C SaaS, missing a committed date doesn't just affect one client relationship: it affects renewal and the platform's own revenue potential. I learned firsthand that shipping on time is a revenue lever, not just a schedule metric.

I understand the value of policy documentation

When enterprise clients used the platform, there was no document covering what each permission tier (super admin / admin / one-time) was allowed to do, or a detailed feature guide, so every question got answered verbally or by

testing it live. Documentation was the first thing I prioritized after joining, and it cut out unnecessary operating time.

UX Research (design, interviews, analysis, reporting)

UX Research Intern · Oct 2020–Jan 2021

WHAT I DID

- Supported desk research and study design for new businesses and services when enterprise clients commissioned research.
- Supported quantitative analysis: cleaned outliers and missing data from survey results in Excel, and supported cross-tabulation.
- Ran UX research for AI tax, overseas remittance, and vendor-management services, supporting usability tests, 1:1 interview moderation, and reporting to derive target customer segments and service improvements.

UX report: Moin, overseas remittance app

An ETA set without accounting for the scale of the research put the whole team on late nights for three weeks. Now I check feasibility before taking on a research engagement, and raise it with the team in advance.
